Get Orders API Documentation

Overview

The **Get Orders API** allows users to fetch historical order data from the Petpooja POS system. This API works on a **pull-based model** where the client requests order data for a specific date.

The API returns comprehensive details including Restaurant, Customer, Order, Tax, Discount, and Item-level information.

Integration Requirements

To use this API, users must obtain authentication credentials from Petpooja:

- **app_key**
- **app_secret**
- **access_token**

These credentials must be included in the request body for successful authentication.

Users also need to provide:

- **restID (mapping code)** of the restaurant
- **order_date**

API Endpoint

HTTP Method:

POST

Endpoint:

https://xyz.com/data (Petpooja's endpoint using which users can get the data)

Request Body

A JSON body must be passed along with the POST request (as shown in the curl sample).

Sample Request

```
curl --location --request POST 'https://xyz.com/data' \
--header 'Content-Type: application/json' \
--header 'Cookie: xyz' \

--data '{
   "app_key": "xxxxxxxxxxxxxxxxxxxxxxxx",
   "app_secret": "xxxxxxxxxxxxxxxxxxxxxxxx",
   "access_token": "xxxxxxxxxxxxxxxxxxxxxxxx",
   "restID": "zyzX@13sd",
   "order_date": "2025-09-18",  // Future Dates are not allowed.
   "refId": ""
}'
```

Important Notes

The API returns **T-1 data**, meaning:

- If you pass **2025-09-18**,
- You will receive orders for **2025-09-17**.

Each order object contains:

- Restaurant details
- Customer details
- Order details
- Tax information
- Discount information
- OrderItem list with taxes/discounts/addons

Sample Response Payload

Questions

Data & Timing

Q: Is this real-time data?

A: No — pull-based, non-real-time. You request a specific order_date and get T-1 data back.

Q: Exactly how does the T-1 date work?

A: Please note that to fetch the sales data for October 10th, you will need to enter the date as October 11th. The API will return the overall sales data for October 10th, along with the data for October 11th up until the time the call is made.

We suggest calling this API after closing hours to ensure you retrieve the most accurate sales data.

Q: Can we pull a date range - week-wise or month-wise - in one call?

A: No.only a single date per call is supported.

Q: How far back can we pull historical data?

A: From 2021 onwards.

Q: What happens if there were no orders on the requested date?

A: No data is returned, or you'll get a "No Records Found" message.

Access, Credentials & Multi-Outlet

Q: We have multiple outlets - does one set of credentials cover all of them, or do we need to enable each separately?

A: Each outlet needs to be enabled individually and gets its own restID (mapping code). A client with 5 outlets needed each one enabled one-by-one before they could start pulling data - share your full outlet list (Petpooja IDs) upfront so all of them can be enabled together rather than one at a time.

Q: Is there a sandbox or test environment?

A: No - this is direct/production integration only, no sandbox for Get Orders.

Q: What's the process to get this enabled?

A: Share your outlet RestIDs → we enable the integration and share the mapping code + credentials (app_key, app_secret, access_token) per outlet.

Technical Integration

Q: What HTTP method and endpoint do we use?

A: POST Method is used for this API and Actual production endpoint we will provide you upon API configuration.

Q: Can we poll on a schedule, or is push/webhook also available here?

A: This API is pull-only - no webhook option. You call it on your own schedule; since it's built for post-closing-hours retrieval, we recommend scheduling calls off-peak rather than continuous polling.

Q: Are there rate limits?

A: No hard limit, but avoid hitting it continuously off-peak, scheduled calls are recommended.

Q: What does the response actually contain?

A: Order-level data only — Restaurant, Customer, Order (with a unique refId, order type, payment type), Tax, Discount, and item-level detail with add-ons. The order_from field tells you the source of each order (POS, or an aggregator like Zomato), so aggregator and direct orders both come through the same call.

Scope & Limitations

Q: Can we get pre-aggregated or summary reports (e.g., daily totals) instead of raw orders?

A: No - raw, order-level data only. Aggregation has to happen on your end, or use the built-in Petpooja dashboard reports.

Q: Does one call cover aggregator orders too, or only direct POS orders?

A: Both - order_from in the response tells you which channel each order came from.

Conclusion

The **Get Orders API** is a reliable method for retrieving past order data from the Petpooja POS system. With proper authentication and date-based querying, you can seamlessly integrate daily sales data into your internal systems.
